

# Example session for Weight-based deduplication

Andreas Borg, Murat Sariyar

August 24, 2020

This document shows an example session using the package *RecordLinkage*. A single data set is deduplicated using an EM algorithm for weight calculation. Conducting linkage of two data sets differs only in the step of generating record pairs.

## 1 Generating record pairs

The data to be deduplicated is expected to reside in a data frame or matrix, each row containing one record. Example data sets of 500 and 10000 records are included in the package as `RLdata500` and `RLdata10000`.

```
data(RLdata500)
RLdata500[1:5,]

##   fname_c1 fname_c2 lname_c1 lname_c2   by bm bd
## 1  CARSTEN   <NA>    MEIER    <NA> 1949 7 22
## 2    GERD    <NA>    BAUER    <NA> 1968 7 27
## 3  ROBERT   <NA>  HARTMANN <NA> 1930 4 30
## 4  STEFAN   <NA>    WOLFF    <NA> 1957 9  2
## 5    RALF   <NA>    KRUEGER  <NA> 1966 1 13
```

For deduplication, `compare.dedup` is to be used. In this example, blocking is set to return only record pairs which agree in at least two components of the subdivided date of birth, resulting in 810 pairs. The argument `identity` preserves the true matching status for later evaluation.

```
pairs=compare.dedup(RLdata500,identity=identity.RLdata500,
                    blockfld=list(c(5,6),c(6,7),c(5,7)))
summary(pairs)

##
## Deduplication Data Set
##
## 500 records
## 571 record pairs
##
## 49 matches
## 522 non-matches
## 0 pairs with unknown status
```

## 2 Weight calculation

Weights are calculated by means of an EM algorithm. This step is computationally intensive and might take a while. The histogram shows the resulting weight distribution.

```
pairs=emWeights(pairs)
```

```
hist(pairs$Wdata, plot=FALSE)
```

```

```

## 3 Classification

For determining thresholds, record pairs within a given range of weights can be printed using `getPairs`<sup>1</sup>. In this case, 24 is set as upper and -7 as lower threshold, dividing links, possible links and non-links. The summary shows the resulting contingency table and error measures.

```
getPairs(pairs,30,20)
```

```
##      id fname_c1 fname_c2 lname_c1 lname_c2   by bm bd
## 23 457  URSULA   BIRGIT  MUELLER   <NA> 1940 6 15
```

<sup>1</sup>The output of `getPairs` is shortened in this document.

```

Review of the record pairs denoted as possible links is facilitated by `getPairs`, which can be forced to show only possible links via argument `show`. A list with the ids of linked pairs can be extracted from the output of `getPairs` with argument `single.rows` set to `TRUE`.

```
possibles <- getPairs(pairs, show="possible")
possibles[1:6,]

##      id  fname_c1  fname_c2  lname_c1  lname_c2   by  bm  bd
