

# Package ‘causloptim’

June 9, 2021

**Encoding** UTF-8

**Type** Package

**Title** An Interface to Specify Causal Graphs and Compute Bounds on Causal Effects

**Version** 0.8.2

**Date** 2021-06-09

**Maintainer** Michael C Sachs <sachsmc@gmail.com>

**Description** When causal quantities are not identifiable from the observed data, it still may be possible to bound these quantities using the observed data. We outline a class of problems for which the derivation of tight bounds is always a linear programming problem and can therefore, at least theoretically, be solved using a symbolic linear optimizer. We extend and generalize the approach of Balke and Pearl (1994) <doi:10.1016/B978-1-55860-332-5.50011-0> and we provide a user friendly graphical interface for setting up such problems via directed acyclic graphs (DAG), which only allow for problems within this class to be depicted. The user can then define linear constraints to further refine their assumptions to meet their specific problem, and then specify a causal query using a text interface. The program converts this user defined DAG, query, and constraints, and returns tight bounds. The bounds can be converted to R functions to evaluate them for specific datasets, and to latex code for publication. The methods and proofs of tightness and validity of the bounds are described in a preprint by Sachs, Gabriel, and Sjölander (2020) <<https://sachsmc.github.io/causloptim/articles/CausalBoundsMethods.pdf>>.

causaloctim-package    *An Interface to Specify Causal Graphs and Compute Bounds on Causal Effects*

---

## Description

Specify causal graphs using a visual interactive interface and then analyze them and compute symbolic bounds for the causal effects in terms of the observable parameters.

## Details

Run the shiny app by results <- specify\_graph(). See detailed instructions in the vignette browseVignettes("causaloctim").

## Author(s)

Michael C Sachs, Arvid Sjölander, Alexander Balke, Colorado Reed, and Erin Gabriel Maintainer: Michael C Sachs <sachsmc at gmail.com>

---

analyze\_graph    *Analyze the causal graph to determine constraints and objective*

---

## Description

The graph must contain edge attributes named "leftside" and "lconnect" that takes values 0 and 1. Only one edge may have a value 1 for lconnect. The shiny app returns a graph in this format.

## Usage

```
analyze_graph(graph, constraints, effectt)
```

**Arguments**

graph	An <a href="#">aaa-igraph-package</a> object that represents a directed acyclic graph
constraints	A vector of character strings that represent the constraints
effectt	A character string that represents the causal effect of interest

**Value**

An object of class "linearcausalproblem", which is a list with the following components. This list can be passed to [optimize\\_effect](#) which interfaces with Balke's code. Print and plot methods are also available.

**variables** Character vector of variable names of potential outcomes, these start with 'q' to match Balke's notation

**parameters** Character vector of parameter names of observed probabilities, these start with 'p' to match Balke's notation

**constraints** Character vector of parsed constraints

**objective** Character string defining the objective to be optimized in terms of the variables

**p.vals** Matrix of all possible values of the observed data vector, corresponding to the list of parameters.

**q.vals** Matrix of all possible values of the response function form of the potential outcomes, corresponding to the list of variables.

**parsed.query** A nested list containing information on the parsed causal query.

**objective.nonreduced** The objective in terms of the original variables, before algebraic variable reduction. The nonreduced variables can be obtained by concatenating the columns of q.vals.

**response.functions** List of response functions.

**graph** The graph as passed to the function.

**R** A matrix with coefficients relating the p.vals to the q.vals  $p = R * q$

**c0** A vector of coefficients relating the q.vals to the objective function  $\theta = c0 * q$

**iqR** A matrix with coefficients to represent the inequality constraints

**Examples**

```
### confounded exposure and outcome
b <- igrgraph::graph_from_literal(X --> Y, Ur --> X, Ur --> Y)
V(b)$leftside <- c(0,0,0)
V(b)$latent <- c(0,0,1)
E(b)$rlconnect <- E(b)$edge.monotone <- c(0, 0, 0)
analyze_graph(b, constraints = NULL, effectt = "p{Y(X = 1) = 1} - p{Y(X = 0) = 1}")
```

---

btm_var	<i>Recursive function to get the last name in a list</i>
---------	--

---

**Description**

Recursive function to get the last name in a list

**Usage**

```
btm_var(x, name = NULL)
```

**Arguments**

x	a list
name	name of the top element of the list

**Value**

The name of the deepest nested list element

---

const.to.sets	<i>Translate lists of constraints to lists of vectors</i>
---------------	---

---

**Description**

Translate lists of constraints to lists of vectors

**Usage**

```
const.to.sets(constr, objterms)
```

**Arguments**

constr	List of constraint terms as character strings
objterms	Vector of terms in the objective function

---

constant_term	<i>Compute the scalar product of two numeric vectors of the same length</i>
---------------	---

---

**Description**

A helper function for [evaluate\\_objective](#).

**Usage**

```
constant_term(numbers1, numbers2)
```

**Arguments**

numbers1, numbers2  
Two numeric vectors of the same length.

**Value**

A string consisting of the value of the scalar product of numbers1 and numbers2.

---

create_effect_vector	<i>Translate target effect to vector of response variables</i>
----------------------	--

---

**Description**

Translate target effect to vector of response variables

**Usage**

```
create_effect_vector(effect, graph, obsvars, respvars, q.list, variables)
```

**Arguments**

effect	Effect list, as returned by <a href="#">parse_effect</a>
graph	The graph
obsvars	Vector of observed variable vertices from the graph
respvars	Response function, as returned by <a href="#">create_response_function</a>
q.list	List with q matrices, as returned by <a href="#">create_q_matrix</a>
variables	Vector of qs names

**Value**

A list with the target effect in terms of qs

---

create_q_matrix	<i>Translate response functions into matrix of counterfactuals</i>
-----------------	--

---

**Description**

Translate response functions into matrix of counterfactuals

**Usage**

```
create_q_matrix(respvars, right.vars, cond.vars, constraints)
```

**Arguments**

respvars	A list of functions as returned by <a href="#">create_response_function</a>
right.vars	Vertices of graph on the right side
cond.vars	Vertices of graph on the left side
constraints	A vector of character strings that represent the constraints

**Value**

A list of 3 data frames of counterfactuals and their associated labels

---

create_response_function	<i>Translate regular DAG to response functions</i>
--------------------------	--

---

**Description**

Translate regular DAG to response functions

**Usage**

```
create_response_function(graph, right.vars, cond.vars)
```

**Arguments**

graph	An <a href="#">aaa-igraph-package</a> object that represents a directed acyclic graph must contain edge attributes named "leftside" and "lconnect" that takes values 0 and 1. Only one edge may have a value 1 for lconnect. The shiny app returns a graph in this format.
right.vars	Vertices of graph on the right side
cond.vars	Vertices of graph on the left side

**Value**

A list of functions representing the response functions

---

create_R_matrix	<i>Create constraint matrix</i>
-----------------	---------------------------------

---

**Description**

Matrix and text representation of constraints on observed probabilities

**Usage**

```
create_R_matrix(
  graph,
  obsvars,
  respvars,
  p.vals,
  parameters,
  q.list,
  variables
)
```

**Arguments**

graph	The graph
obsvars	Vector of observed variable vertices from the graph
respvars	Response function, as returned by <a href="#">create_response_function</a>
p.vals	Observed probability matrix
parameters	Vector of ps names
q.list	List with q matrices, as returned by <a href="#">create_q_matrix</a>
variables	Vector of qs names

**Value**

A list with the R matrix and the string representation

---

evaluate_objective	<i>Compute the scalar product of a vector of numbers and a vector of both numbers and strings</i>
--------------------	---

---

**Description**

A helper function for [opt\\_effect](#).

**Usage**

```
evaluate_objective(c1_num, p, y)
```

**Arguments**

c1_num	A numeric column matrix.
p	A character vector.
y	A numeric vector whose length is the sum of the lengths of c1_num and p.

**Value**

A string consisting of an affine expression in p corresponding to the scalar product of c(c1\_num, p) with y.

---

expand_cond	<i>Expand potential outcome conditions</i>
-------------	--

---

**Description**

Expand potential outcome conditions

**Usage**

```
expand_cond(cond, obsnames)
```

**Arguments**

cond	Text string of the condition
obsnames	Vector of names of observed variables

---

find_cycles	<i>Find cycles in a graph</i>
-------------	-------------------------------

---

**Description**

Find cycles in a graph

**Usage**

```
find_cycles(g)
```

**Arguments**

g	an igraph object
---	------------------

**Value**

A list of vectors of integers, indicating the vertex sequences for the cycles found in the graph

---

interpret_bounds	<i>Convert bounds string to a function</i>
------------------	--

---

**Description**

Convert bounds string to a function

**Usage**

```
interpret_bounds(bounds, parameters)
```

**Arguments**

bounds	The bounds element as returned by <a href="#">optimize_effect</a>
parameters	Character vector defining parameters, as returned by <a href="#">analyze_graph</a>

**Value**

A function that takes arguments for the parameters, i.e., the observed probabilities and returns a vector of length 2: the lower bound and the upper bound.

**Examples**

```
b <- graph_from_literal(X -- Y, Ur -- X, Ur -- Y)
V(b)$leftside <- c(0,0,0)
V(b)$latent <- c(0,0,1)
E(b)$rconnect <- E(b)$edge.monotone <- c(0, 0, 0)
obj <- analyze_graph(b, constraints = NULL, effectt = "p{Y(X = 1) = 1} - p{Y(X = 0) = 1}")
bounds <- optimize_effect(obj)
bounds_func <- interpret_bounds(bounds$bounds, obj$parameters)
bounds_func(.1, .1, .4, .3)
# vectorized
do.call(bounds_func, lapply(1:4, function(i) runif(5)))
```

---

latex_bounds	<i>Latex bounds equations</i>
--------------	-------------------------------

---

**Description**

Latex bounds equations

**Usage**

```
latex_bounds(bounds, parameters, prob.sym = "P", brackets = c("(", ")"))
```

**Arguments**

bounds	Vector of bounds as returned by <a href="#">optimize_effect</a>
parameters	The parameters object as returned by <a href="#">analyze_graph</a>
prob.sym	Symbol to use for probability statements in latex, usually "P" or "Pr"
brackets	Length 2 vector with opening and closing bracket, usually c("(", ")"), or c("\", "\")

**Value**

A character string with latex code for the bounds

**Examples**

```
b <- graph_from_literal(X -- Y, Ur -- X, Ur -- Y)
V(b)$leftside <- c(0,0,0)
V(b)$latent <- c(0,0,1)
E(b)$rconnect <- E(b)$edge.monotone <- c(0, 0, 0)
obj <- analyze_graph(b, constraints = NULL, effectt = "p{Y(X = 1) = 1} - p{Y(X = 0) = 1}")
bounds <- optimize_effect(obj)
latex_bounds(bounds$bounds, obj$parameters)
latex_bounds(bounds$bounds, obj$parameters, "Pr")
```

---

linear_expression	<i>Compute the scalar product of a vector of numbers and a vector of strings</i>
-------------------	--

---

**Description**

A helper function for [evaluate\\_objective](#).

**Usage**

```
linear_expression(numbers, strings)
```

**Arguments**

numbers	A numeric vector.
strings	A character vector of the same length as numbers.

**Value**

A string consisting of the corresponding linear combination, including the sign of its first term.

---

linear_term	<i>Compute the product of a single numeric scalar and a single string</i>
-------------	---

---

**Description**

A helper function for [linear\\_expression](#).

**Usage**

```
linear_term(number, string)
```

**Arguments**

number	A numeric vector of length 1.
string	A character vector of length 1.

**Value**

A string consisting of the concatenation of number and string, including its sign.

---

list_to_path	<i>Recursive function to translate an effect list to a path sequence</i>
--------------	--

---

**Description**

Recursive function to translate an effect list to a path sequence

**Usage**

```
list_to_path(x, name = NULL)
```

**Arguments**

x	A list of vars as returned by <code>parse_effect</code>
name	The name of the outcome variable

**Value**

a list of characters describing the path sequence

---

optimize_effect	<i>Run the Balke optimizer</i>
-----------------	--------------------------------

---

### Description

Given a object with the linear programming problem set up, compute the bounds using the c++ code developed by Alex Balke. Bounds are returned as text but can be converted to R functions using [interpret\\_bounds](#), or latex code using [latex\\_bounds](#).

### Usage

```
optimize_effect(obj)
```

### Arguments

obj                    Object as returned by [analyze\\_graph](#)

### Value

An object of class "balkebound" that contains the bounds and logs as character strings

### Examples

```
b <- graph_from_literal(X -- Y, Ur -- X, Ur -- Y)
V(b)$leftside <- c(0,0,0)
V(b)$latent <- c(0,0,1)
E(b)$rconnect <- E(b)$edge.monotone <- c(0, 0, 0)
obj <- analyze_graph(b, constraints = NULL, effectt = "p{Y(X = 1) = 1} - p{Y(X = 0) = 1}")
optimize_effect(obj)
```

---

optimize_effect_2	<i>Run the optimizer</i>
-------------------	--------------------------

---

### Description

Given an object with the linear programming problem set up, compute the bounds using rcdd. Bounds are returned as text but can be converted to R functions using [interpret\\_bounds](#), or latex code using [latex\\_bounds](#).

### Usage

```
optimize_effect_2(obj)
```

### Arguments

obj                    Object as returned by [analyze\\_graph](#)

**Value**

An object of class "balkebound" that contains the bounds and logs as character strings

**Examples**

```
b <- graph_from_literal(X -+ Y, Ur -+ X, Ur -+ Y)
V(b)$leftside <- c(0,0,0)
V(b)$latent <- c(0,0,1)
E(b)$rlconnect <- E(b)$edge.monotone <- c(0, 0, 0)
obj <- analyze_graph(b, constraints = NULL, effectt = "p{Y(X = 1) = 1} - p{Y(X = 0) = 1}")
optimize_effect_2(obj)
```

---

opt\_effect

*Compute a bound on the average causal effect*

---

**Description**

This helper function does the heavy lifting for [optimize\\_effect\\_2](#). For a given casual query, it computes either a lower or an upper bound on the corresponding causal effect.

**Usage**

```
opt_effect(opt, obj)
```

**Arguments**

**opt** A string. Either "min" or "max" for a lower or an upper bound, respectively.

**obj** An object as returned by the function [analyze\\_graph](#). Contains the casual query to be estimated.

**Value**

An object of class optbound; a list with the following named components:

- **expr** is the *main* output; an expression of the bound as a print-friendly string,
- **type** is either "lower" or "upper" according to the type of the bound,
- **dual\_vertices** is a numeric matrix whose rows are the vertices of the convex polytope of the dual LP,
- **dual\_vrep** is a V-representation of the dual convex polytope, including some extra data.

---

parse\_constraints      *Parse text that defines a the constraints*

---

**Description**

Parse text that defines a the constraints

**Usage**

```
parse_constraints(constraints, obsnames)
```

**Arguments**

constraints	A list of character strings
obsnames	Vector of names of the observed variables in the graph

**Value**

A data frame with columns indicating the variables being constrained, what the values of their parents are for the constraints, and the operator defining the constraint (equality or inequalities).

---

parse\_effect      *Parse text that defines a causal effect*

---

**Description**

Parse text that defines a causal effect

**Usage**

```
parse_effect(text)
```

**Arguments**

text	Character string
------	------------------

**Value**

A nested list that contains the following components:

**vars** For each element of the causal query, this indicates potential outcomes as names of the list elements, the variables that they depend on, and the values that any variables are being fixed to.

**oper** The vector of operators (addition or subtraction) that combine the terms of the causal query.

**values** The values that the potential outcomes are set to in the query (0 or 1).

**pcheck** List of logicals for each element of the query that are TRUE if the element is a potential outcome and FALSE if it is an observational quantity.

---

<code>pastestar</code>	<i>Paste with asterisk sep</i>
------------------------	--------------------------------

---

**Description**

Paste with asterisk sep

**Usage**

```
pastestar(...)
```

**Arguments**

... Things to paste together

---

<code>plot.linearcausalproblem</code>	<i>Plot the graph from the causal problem</i>
---------------------------------------	---

---

**Description**

Plot the graph from the causal problem

**Usage**

```
## S3 method for class 'linearcausalproblem'  
plot(x, ...)
```

**Arguments**

x object of class "linearcausaloptim"  
... Not used

**Value**

Nothing

---

plot_graphres	<i>Plot the analyzed graph object</i>
---------------	---------------------------------------

---

**Description**

Special plotting method for igraphs of this type

**Usage**

```
plot_graphres(graphres)
```

**Arguments**

graphres      an igraph object

**Value**

None

---

print.linearcausalproblem	<i>Print the causal problem</i>
---------------------------	---------------------------------

---

**Description**

Print the causal problem

**Usage**

```
## S3 method for class 'linearcausalproblem'  
print(x, ...)
```

**Arguments**

x              object of class "linearcausaloitim"  
...             Not used

**Value**

x, invisibly

---

reduce.sets	<i>Algebraically reduce sets</i>
-------------	----------------------------------

---

**Description**

Identifies and reduces redundant variables

**Usage**

```
reduce.sets(sets)
```

**Arguments**

sets	List of constraints as sets of variables
------	--

---

shortentxt	<i>Shorten strings to 80 characters wide</i>
------------	--

---

**Description**

Shorten strings to 80 characters wide

**Usage**

```
shortentxt(x)
```

**Arguments**

x	String
---	--------

---

simulate_bounds	<i>Simulate bounds</i>
-----------------	------------------------

---

**Description**

Run a simple simulation based on the bounds. For each simulation, sample the set of counterfactual probabilities from a uniform distribution, translate into a multinomial distribution, and then compute the objective and the bounds in terms of the observable variables.

**Usage**

```
simulate_bounds(obj, bounds, nsim = 1000)
```

**Arguments**

obj	Object as returned by <a href="#">analyze_graph</a>
bounds	Object as returned by <a href="#">optimize_effect</a>
nsim	Number of simulation replicates

**Value**

A data frame with columns: objective, bound.lower, bound.upper

**Examples**

```
b <- graph_from_literal(X -- Y, Ur -- X, Ur -- Y)
V(b)$leftside <- c(0,0,0)
V(b)$latent <- c(0,0,1)
E(b)$r1connect <- E(b)$edge.monotone <- c(0, 0, 0)
obj <- analyze_graph(b, constraints = NULL, effectt = "p{Y(X = 1) = 1} - p{Y(X = 0) = 1}")
bounds <- optimize_effect(obj)
simulate_bounds(obj, bounds, nsim = 5)
```

---

specify\_graph

*Shiny interface to specify network structure and compute bounds*

---

**Description**

This launches the Shiny interface in the system's default web browser. The results of the computation will be displayed in the browser, but they can also be returned to the R session by assigning the result of the function call to an object. See below for information on what is returned.

**Usage**

```
specify_graph()
```

**Value**

If the button "Exit and return graph object" is clicked, then only the graph is returned as an [aaa-igraph-package](#) object.

If the bounds are computed and the button "Exit and return objects to R" is clicked, then a list is returned with the following elements:

**graphres** The graph as drawn and interpreted, an [aaa-igraph-package](#) object.

**obj** The objective and all necessary supporting information. This object is documented in [analyze\\_graph](#). This can be passed directly to [optimize\\_effect](#).

**bounds.obs** Object of class 'balkebound' as returned by [optimize\\_effect](#).

**constraints** Character vector of the specified constraints. NULL if no constraints.

**effect** Text describing the causal effect of interest.

**boundsFunction** Function that takes parameters (observed probabilities) as arguments, and returns a vector of length 2 for the lower and upper bounds.

---

symb.subtract	<i>Symbolic subtraction</i>
---------------	-----------------------------

---

**Description**

Like setdiff but doesn't remove duplicates  $x1 - x2$

**Usage**

```
symb.subtract(x1, x2)
```

**Arguments**

x1	First term (subtract from)
x2	Second term (subtract)

---

update_effect	<i>Update the effect in a linearcausalproblem object</i>
---------------	--

---

**Description**

If you want to use the same graph and response function, but change the effect of interest, this can save some computation time.

**Usage**

```
update_effect(obj, effectt)
```

**Arguments**

obj	An object as returned by <a href="#">analyze_graph</a>
effectt	A character string that represents the causal effect of interest

**Value**

A object of class linearcausalproblem, see [analyze\\_graph](#) for details
