

Package ‘ggpp’

July 31, 2021

Type Package

Title Grammar Extensions to 'ggplot2'

Version 0.4.2

Date 2021-07-30

Maintainer Pedro J. Aphalo <pedro.aphalo@helsinki.fi>

Description Extensions to 'ggplot2' respecting the grammar of graphics paradigm. Geomas: `geom_table()`, `geom_plot()` and `geom_grob()` add insets to plots using native data coordinates, while `geom_table_npc()`, `geom_plot_npc()` and `geom_grob_npc()` do the same using ``npc`` coordinates through new aesthetics ``npcx`` and ``npcy``. Statistics: select observations based on 2D density. Positions: radial nudging away from a center point and nudging away from a line or curve.

ggpp: Grammar Extensions to 'ggplot2'

Description

Extensions to 'ggplot2' respecting the grammar of graphics paradigm. Geomas: `geom_table()`, `geom_plot()` and `geom_grob()` add insets to plots using native data coordinates, while `geom_table_npc()`, `geom_plot_npc()` and `geom_grob_npc()` do the same using "npc" coordinates through new aesthetics "npcx" and "npcy". Statistics: select observations based on 2D density. Positions: radial nudging away from a center point and nudging away from a line or curve.

Details

Package 'ggpp' provides functions that extend the grammar of graphics as implemented in 'ggplot2'. It attempts to stay true to the original grammar and to respect the naming conventions used in 'ggplot2'.

Extensions provided:

- Geoms adding support for plot, table and grob insets within the grammar. Geoms using a parallel pseudo-scale based on native plot coordinates (`npc`) to allow annotations consistent with the grammar and so supporting facets and grouping. Geoms for annotations on the edges of the plotting area. Geom for easily drawing lines separating the quadrants of a plot.
- Stats for filtering-out/filtering-in observations in regions of a panel or group where the density of observations is high. Statistics simultaneously computing summaries, optionally using different functions, along x and y. Stat computing quadrant counts.
- Position functions implementing multi-directional nudging based on the data.
- Scales. Pseudo-scales supporting `npc` coordinates for x and y.
- Specializations of the `ggplot()` generic accepting time series objects of classes `ts` and `xts` as data argument.

Acknowledgements

We thank Kamil Slowikowski not only for contributing ideas and code examples to this package but also for adding new features to his package 'ggrepel' that allow new use cases for `stat_dens2d_labels()`, `position_nudge_center()`, `position_nudge_line()` and `position_nudge_to()` from this package. This package includes code copied and/or modified from that in package 'ggplot2'.

 annotate

Annotations supporting NPC

Description

A revised version of `annotate()` from package 'ggplot2' adding support for `npcx` and `npcy` position aesthetics, allowing use of the geometries defined in the current package such as `geom_text_npc()`. It also has a parameter `label` that directly accepts data frames, ggplots and grobs as arguments in addition to objects of atomic classes like character. When package 'ggpmisc' is loaded this definition of `annotate()` overrides that in package 'ggplot2'.

Usage

```
annotate(
  geom,
  x = NULL,
  y = NULL,
  xmin = NULL,
  xmax = NULL,
  ymin = NULL,
  ymax = NULL,
  xend = NULL,
  yend = NULL,
  npcx = NULL,
  npcy = NULL,
  label = NULL,
  ...,
  na.rm = FALSE
)
```

Arguments

<code>geom</code>	character Name of geom to use for annotation.
<code>x</code> , <code>y</code> , <code>xmin</code> , <code>ymin</code> , <code>xmax</code> , <code>ymax</code> , <code>xend</code> , <code>yend</code> , <code>npcx</code> , <code>npcy</code>	numeric Positioning aesthetics - you must specify at least one of these.
<code>label</code>	character, data.frame, ggplot or grob.
<code>...</code>	Other named arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>color = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.
<code>na.rm</code>	logical If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

Details

Note that all position aesthetics are scaled (i.e., they will expand the limits of the plot so they are visible), but all other aesthetics are set. This means that layers created with this function will never affect the legend.

Value

A plot layer instance.

Note

To use the original definition of `annotate()` after loading package 'ggpmisc', use `ggplot2::annotate()`.

Examples

```
p <- ggplot(mtcars, aes(x = wt, y = mpg)) + geom_point()

# Works as ggplot2::annotate()
p + annotate("text", x = 5, y = 32, label = "Some text")
p + annotate("label", x = c(2, 5), y = c(15, 32),
            label = c("A", "B"))
p + annotate("table", x = 5, y = 30,
            label = data.frame(A = 1:2, B = letters[1:2]))
p + annotate("plot", x = 5.5, y = 34,
            label = p + theme_bw(9))
p + annotate("rect", xmin = 3, xmax = 4.2, ymin = 12, ymax = 21, alpha = .2)
p + annotate("segment", x = 2.5, xend = 4, y = 15, yend = 25, colour = "blue")
p + annotate("pointrange", x = 3.5, y = 20, ymin = 12, ymax = 28,
            colour = "red", size = 1.5)

# But ggpmisc::annotate() also works with npcx and npcy pseudo-aesthetics
p + annotate("label_npc", npcx = c(0.1, 0.9), npcy = c(0.1, 0.9),
            label = c("A", "B"))
p + annotate("label_npc", npcx = 0.9, npcy = c(0.1, 0.9),
            label = c("A", "B"))

p + annotate("text_npc", npcx = 0.9, npcy = 0.9, label = "Some text")
p + annotate("text_npc", npcx = "right", npcy = "top", label = "Some text")

p + annotate("table_npc", npcx = 0.9, npcy = 0.9,
            label = data.frame(A = 1:2, B = letters[1:2]))

p + annotate("plot_npc", npcx = 1, npcy = 1,
            label = p + theme_bw(9))
p + annotate("plot_npc", npcx = c(0, 1), npcy = c(0, 1),
            label = list(p + theme_bw(9), p + theme_grey(9)),
            vp.width = 0.3, vp.height = 0.4)
```

Description

`geom_grob` and `geom_grob_npc` add a Grob as inset to the ggplot using syntax similar to that of `geom_label`. In most respects they behave as any other ggplot geometry: a layer can contain multiple tables and faceting works as usual.

Usage

```
geom_grob(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

```
geom_grob_npc(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

Arguments

<code>mapping</code>	The aesthetic mapping, usually constructed with <code>aes</code> or <code>aes_</code> . Only needs to be set at the layer level if you are overriding the plot defaults.
<code>data</code>	A layer specific dataset - only needed if you want to override the plot defaults.
<code>stat</code>	The statistical transformation to use on the data for this layer, as a string.
<code>position</code>	Position adjustment, either as a string, or the result of a call to a position adjustment function.
<code>...</code>	other arguments passed on to <code>layer</code> . This can include aesthetics whose values you want to set, not map. See <code>layer</code> for more details.
<code>na.rm</code>	If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
<code>show.legend</code>	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
<code>inherit.aes</code>	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. <code>borders</code> .

Details

The "width" and "height" of an inset as for a text element are 0, so stacking and dodging inset plots will not work by default, and axis limits are not automatically expanded to include all inset plots. Obviously, insets do have height and width, but they are physical units, not data units. The amount of space they occupy on the main plot is not constant in data units of the base plot: when you modify scale limits, inset plots stay the same size relative to the physical size of the base plot.

Value

A plot layer instance.

Alignment

You can modify table alignment with the `vjust` and `hjust` aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top").

Inset size

You can modify inset plot size with the `vp.width` and `vp.height` aesthetics. These can be a number between 0 (smallest possible inset) and 1 (whole plotting area width or height). The default value for for both of these aesthetics is 1/3.

Note

These geoms work only with tibbles as data, as they expects a list of graphics objects ("grob") to be mapped to the `label` aesthetic. Aesthetics mappings in the inset plot are independent of those in the base plot.

In the case of `geom_grob()`, `x` and `y` aesthetics determine the position of the whole inset grob, similarly to that of a text label, justification is interpreted as indicating the position of the grob with respect to the `$x` and `$y` coordinates in the data, and `angle` is used to rotate the plot as a whole.

In the case of `geom_grob_npc()`, `npcx` and `npcy` aesthetics determine the position of the whole inset plot, similarly to that of a text label, justification is interpreted as indicating the position of the grob with respect to the `$x` and `$y` coordinates in "npc" units, and `angle` is used to rotate the plot as a whole.

`annotate()` **cannot be used with** `geom = "grob"`. Use `annotation_custom` directly when adding inset plots as annotations.

References

The idea of implementing a `geom_custom()` for grobs has been discussed as an issue at <https://github.com/tidyverse/ggplot2/issues/1399>.

Other geometries adding layers with insets: `geom_plot()`, `geom_table()`

Examples

```
library(tibble)
df <- tibble(x = 2, y = 15, grob = list(grid::circleGrob(r = 0.2)))
ggplot(data = mtcars, aes(wt, mpg)) +
  geom_point(aes(colour = factor(cyl))) +
  geom_grob(data = df, aes(x, y, label = grob))
```

 geom_label_npc

Text with Normalised Parent Coordinates

Description

‘geom_text_npc()’ adds text directly to the plot. ‘geom_label_npc()’ draws a rectangle behind the text, making it easier to read. The difference is that x and y mappings are expected to be given in ‘npc’ graphic units. They are intended to be used for positioning text relative to the physical dimensions of a plot. This can be achieved with ‘annotate()’ except when faceting is used.

Usage

```
geom_label_npc(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  label.padding = grid::unit(0.25, "lines"),
  label.r = grid::unit(0.15, "lines"),
  label.size = 0.25,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

```
geom_text_npc(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  check_overlap = FALSE,
```

```

na.rm = FALSE,
show.legend = FALSE,
inherit.aes = FALSE
)

```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific data set - only needed if you want to override the plot defaults.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.
parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>?plotmath</code> .
nudge_x, nudge_y	Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales.
label.padding	Amount of padding around label. Defaults to 0.25 lines.
label.r	Radius of rounded corners. Defaults to 0.15 lines.
label.size	Size of label border, in mm.
na.rm	If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .
check_overlap	If 'TRUE', text that overlaps previous text in the same layer will not be plotted.

Details

Note that the "width" and "height" of a text element are 0, so stacking and dodging text will not work by default, and axis limits are not automatically expanded to include all text. Obviously, labels do have height and width, but they are physical units, not data units. The amount of space they occupy on the plot is not constant in data units: when you resize a plot, labels stay the same size, but the size of the axes changes.

'`geom_text_npc()`' and '`geom_label_npc()`' add labels for each row in the data, even if coordinates `x`, `y` are set to single values in the call to '`geom_label_npc()`' or '`geom_text_npc()`'. To add labels at specified points use `[annotate()]` with '`annotate(geom = "text_npc", ...)`' or '`annotate(geom = "label_npc", ...)`'.

Value

A plot layer instance.

‘geom_label_npc()’

Currently ‘geom_label_npc()’ does not support the ‘angle’ aesthetic and is considerably slower than ‘geom_text_npc()’. The ‘fill’ aesthetic controls the background colour of the label.

Alignment

You can modify text alignment with the ‘vjust’ and ‘hjust’ aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character (“left”, “middle”, “right”, “bottom”, “center”, “top”). There are two special alignments: “inward” and “outward”. Inward always aligns text towards the center, and outward aligns it away from the center. When using textual positions a shift is added based on grouping, however unused levels are not dropped. In plots with faceting so that not all groups appear in each panel, gaps will appear in between labels. To solve this pass numeric values for the npc coordinates of each label instead of character strings.

Note

This geom is identical to ‘ggplot2’ geom_text() except that it interprets x and y positions in npc units. It translates x and y coordinates from npc units to native data units and calls functions from ‘ggplot2’'s GeomText().

Examples

```
df <- data.frame(
  x = c(0, 0, 1, 1, 0.5),
  x.chr = c("left", "left", "right", "right", "center"),
  y = c(0, 1, 0, 1, 0.5),
  y.chr = c("bottom", "top", "bottom", "top", "middle"),
  text = c("bottom-left", "top-left", "bottom-right", "top-right", "center-middle")
)

ggplot(df) +
  geom_text_npc(aes(npcx = x, npcy = y, label = text))

ggplot(df) +
  geom_text_npc(aes(npcx = x.chr, npcy = y.chr, label = text))

ggplot(data = mtcars, mapping = aes(wt, mpg)) +
  geom_point() +
  geom_text_npc(data = df, aes(npcx = x, npcy = y, label = text))

ggplot(data = mtcars, mapping = aes(wt, mpg)) +
  geom_point() +
```

```
geom_text_npc(data = df, aes(npcx = x, npcy = y, label = text)) +
  expand_limits(y = 40, x = 6)

ggplot(data = mtcars) +
  geom_point(mapping = aes(wt, mpg)) +
  geom_label_npc(data = df, aes(npcx = x, npcy = y, label = text))
```

geom_plot

Inset plots

Description

`geom_plot` and `geom_plot_npc` add ggplot objects as insets to the base ggplot, using syntax similar to that of `geom_label`. In most respects they behave as any other ggplot geometry: a layer can contain multiple tables and faceting works as usual.

Usage

```
geom_plot(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

```
geom_plot_npc(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

Arguments

<code>mapping</code>	The aesthetic mapping, usually constructed with <code>aes</code> or <code>aes_</code> . Only needs to be set at the layer level if you are overriding the plot defaults.
<code>data</code>	A layer specific data set - only needed if you want to override the plot defaults.
<code>stat</code>	The statistical transformation to use on the data for this layer, as a string.

<code>position</code>	Position adjustment, either as a string, or the result of a call to a position adjustment function.
<code>...</code>	other arguments passed on to <code>layer</code> . This can include aesthetics whose values you want to set, not map. See <code>layer</code> for more details.
<code>na.rm</code>	If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
<code>show.legend</code>	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
<code>inherit.aes</code>	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. <code>borders</code> .

Details

The "width" and "height" of an inset as for a text element are 0, so stacking and dodging inset plots will not work by default, and axis limits are not automatically expanded to include all inset plots. Obviously, insets do have height and width, but they are physical units, not data units. The amount of space they occupy on the main plot is not constant in data units of the base plot: when you modify scale limits, inset plots stay the same size relative to the physical size of the base plot.

Value

A plot layer instance.

Inset alignment

You can modify inset plot alignment with the `vjust` and `hjust` aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top"). The `angle` aesthetics can be used to rotate the inset plots.

Inset size and aspect

You can modify the size of the inset plot with the `vp.width` and `vp.height` aesthetics. Arguments can be a number between 0 (smallest possible inset) and 1 (whole plotting area width or height). The default value for for both of these aesthetics is 1/3. If the coordinates are "free" the plot stretches to fill the viewport. However, if the coordinates of the inset are "fixed" and the aspect ratio of the viewport is different to that of the inset, the viewport will be surrounded on either $\$x\$$ or $\$y\$$ margins by invisible space, which may look as if the position of the inset is wrong.

Known problem!

In some cases when explicit coordinates are added to the inner plot, it may be also necessary to add explicitly coordinates to the outer plots.

Note

These geoms work only with tibbles as data, as they expects a list of ggplots ("gg" objects) to be mapped to the `label` aesthetic. Aesthetics mappings in the inset plot are independent of those in the base plot.

In the case of `geom_plot()`, `x` and `y` aesthetics determine the position of the whole inset plot, similarly to that of a text label, justification is interpreted as indicating the position of the plot with respect to the `$x` and `$y` coordinates in the data, and `angle` is used to rotate the plot as a whole.

In the case of `geom_plot_npc()`, `npcx` and `npcy` aesthetics determine the position of the whole inset plot, similarly to that of a text label, justification is interpreted as indicating the position of the plot with respect to the `$x` and `$y` coordinates in "npc" units, and `angle` is used to rotate the plot as a whole.

`annotate()` **cannot be used with** `geom = "plot"`. Use `annotation_custom` directly when adding inset plots as annotations.

References

The idea of implementing a `geom_custom()` for grobs has been discussed as an issue at <https://github.com/tidyverse/ggplot2/issues/1399>.

See Also

Other geometries adding layers with insets: `geom_grob()`, `geom_table()`

Examples

```
# inset plot with enlarged detail from a region of the main plot
library(tibble)
p <-
  ggplot(data = mtcars, mapping = aes(wt, mpg)) +
  geom_point()

df <- tibble(x = 0.01, y = 0.01,
             plot = list(p +
                         coord_cartesian(xlim = c(3, 4),
                                         ylim = c(13, 16)) +
                         labs(x = NULL, y = NULL) +
                         theme_bw(10)))

p +
  expand_limits(x = 0, y = 0) +
  geom_plot_npc(data = df, aes(npcx = x, npcy = y, label = plot))

p +
  expand_limits(x = 0, y = 0) +
  geom_plot_npc(data = df,
               vp.width = 1/2, vp.height = 1/4,
               aes(npcx = x, npcy = y, label = plot))
```

Description

geom_vhlines() adds in a single layer both vertical and horizontal guide lines. Can be thought of as a convenience function that helps with producing consistent vertical and horizontal guide lines. It behaves like geom_vline() and geom_hline(). geom_quadrant_lines() displays the boundaries of four quadrants with an arbitrary origin. The quadrants are specified in the same way as in stat_quadrant_counts() and is intended to be used to add guide lines consistent with the counts by quadrant computed by this stat.

Usage

```
geom_quadrant_lines(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  pool.along = "none",
  xintercept = 0,
  yintercept = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE,
  ...
)
```

```
geom_vhlines(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  xintercept = NULL,
  yintercept = NULL,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE,
  ...
)
```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific data set - only needed if you want to override the plot defaults.
stat	The statistic object to use display the data
position	The position adjustment to use for overlapping points on this layer
pool.along	character, one of "none", "x" or "y", indicating which quadrants to pool to calculate counts by pair of quadrants.

<code>xintercept</code> , <code>yintercept</code>	numeric vectors the coordinates of the origin of the quadrants.
<code>na.rm</code>	a logical indicating whether NA values should be stripped before the computation proceeds.
<code>show.legend</code>	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
<code>inherit.aes</code>	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and should not inherit behaviour from the default plot specification, e.g. borders .
<code>...</code>	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.

Details

While `geom_vhlines()` does not provide defaults for the intercepts and accept vectors of length > 1, `geom_quadrant_lines()` sets by default the intercepts to zero producing the natural quadrants and only accepts vectors of length one per panel. That is `geom_vhlines()` can be used to plot a grid while `geom_quadrant_lines()` plots at most one vertical and one horizontal line. In the case of `geom_quadrant_lines()` the pooling along axes can be specified in the same way as in [stat_quadrant_counts\(\)](#).

Value

A plot layer instance.

  theme_bw()

```

 geom_table

Inset tables

Description

geom_table adds a textual table directly to the ggplot using syntax similar to that of [geom_label](#) while geom_table_npc is similar to geom_label_npc in that x and y coordinates are given in npc units. In most respects they behave as any other ggplot geometry: a layer can contain multiple tables and faceting works as usual.

Usage

```

geom_table(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  table.theme = NULL,
  table.rownames = FALSE,
  table.colnames = TRUE,
  table.hjust = 0.5,
  parse = FALSE,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)

```

```

geom_table_npc(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  table.theme = NULL,
  table.rownames = FALSE,
  table.colnames = TRUE,

```

```

    table.hjust = 0.5,
    parse = FALSE,
    na.rm = FALSE,
    show.legend = FALSE,
    inherit.aes = FALSE
  )

```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific data set - only needed if you want to override the plot defaults.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.
table.theme	NULL, list or function A gridExtra ttheme definition, or a constructor for a ttheme or NULL for default.
table.rownames, table.colnames	logical flag to enable or disable printing of row names and column names.
table.hjust	numeric Horizontal justification for the core and column headings of the table.
parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>?plotmath</code> .
na.rm	If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .

Details

These geoms work only with tibbles as data, as they expects a list of data frames or tibbles ("tb" objects) to be mapped to the label aesthetic. Aesthetics mappings in the inset plot are independent of those in the base plot.

In the case of `geom_table()`, `x` and `y` aesthetics determine the position of the whole inset table, similarly to that of a text label, justification is interpreted as indicating the position of the table with respect to the `$x` and `$y` coordinates in the data, and `angle` is used to rotate the table as a whole.

In the case of `geom_table_npc()`, `npcx` and `npcy` aesthetics determine the position of the whole inset table, similarly to that of a text label, justification is interpreted as indicating the position of the table with respect to the `$x` and `$y` coordinates in "npc" units, and `angle` is used to rotate the table as a whole.

The "width" and "height" of an inset as for a text element are 0, so stacking and dodging inset tables will not work by default, and axis limits are not automatically expanded to include all inset tables.

Obviously, insets do have height and width, but they are physical units, not data units. The amount of space they occupy on the main plot is not constant in data units of the base plot: when you modify scale limits, inset plots stay the same size relative to the physical size of the base plot.

If the argument passed to `table.theme` is a constructor function (passing its name without parenthesis), the values mapped to `size`, `colour`, `fill`, `alpha`, and `family` aesthetics will be passed to this theme constructor for each individual table. In contrast, if a ready constructed theme as a list object is passed as argument (e.g., by calling the constructor, using constructor name followed by parenthesis), it will be used as is, i.e., mappings to aesthetics such as `colour` are ignored if present.

By default the constructor `ttheme_gtdefault` is used and `colour` and `fill`, are mapped to `NA`. Mapping these aesthetics to `NA` triggers the use of the default `base_colour` of the `ttheme`.

As the table is built with function `gridExtra::gtable()`, for formatting details, please, consult [tableGrob](#).

Value

A plot layer instance.

Alignment

You can modify table alignment with the `vjust` and `hjust` aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top").

Inset size

You can modify inset table size with the `size` aesthetics, which determines the size of text within the table.

Note

As all geometries, `geom_table()` and `geom_table_npc()` add a layer to a plot, and behave as expected in the grammar of graphics. In general ggplot themes do not affect how layers are rendered, and this is also the case for `geom_table()`. As described above, the formatting of the inset table is done according to the the argument passed to parameter `table.theme`.

Complex tables with annotations or different colouring of rows or cells can be constructed with functions in package 'gridExtra' or in any other way as long as they can be saved as grid graphical objects and then added to a ggplot as a new layer with [geom_grob](#).

In 'ggpmisc' (>= 0.3.6) `annotate()` **can be used with** `geom = "table"`.

References

This geometry is inspired on answers to two questions in Stackoverflow. In contrast to these earlier examples, the current geom obeys the grammar of graphics, and attempts to be consistent with the behaviour of 'ggplot2' geometries. <https://stackoverflow.com/questions/12318120/adding-table-within-the-plotting-region-of-a-ggplot-in-r> <https://stackoverflow.com/questions/25554548/adding-sub-tables-on-each-panel-of-a-facet-ggplot-in-r?>

            mapping = aes(x = x, y = y, label = tb))
```

```
# Using native plot coordinates instead of data coordinates
dfnpc <- tibble(x = 0.95, y = 0.95, tb = list(tb))

ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table_npc(data = dfnpc, aes(npcx = x, npcy = y, label = tb))
```

geom_text_linked *Linked Text*

Description

Text geoms are useful for labelling plots. ‘geom_text_linked()’ adds text to the plot and for nudged positions links the original location to the nudged text with a segment.

Usage

```
geom_text_linked(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  arrow = NULL,
  check_overlap = FALSE,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```

Arguments

mapping	Set of aesthetic mappings created by aes or aes_ . If specified and <code>inherit.aes = TRUE</code> (the default), is combined with the default mapping at the top level of the plot. You only need to supply mapping if there isn’t a mapping defined for the plot.
data	A data frame. If specified, overrides the default data frame defined at the top level of the plot.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
...	other arguments passed on to layer . There are three types of arguments you can use here:

- Aesthetics: to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`.
- Other arguments to the layer, for example you override the default stat associated with the layer.
- Other arguments passed on to the stat.

<code>parse</code>	If TRUE, the labels will be parsed into expressions and displayed as described in <code>?plotmath</code> .
<code>nudge_x</code> , <code>nudge_y</code>	Horizontal and vertical adjustments to nudge the starting position of each text label. The units for <code>nudge_x</code> and <code>nudge_y</code> are the same as for the data units on the x-axis and y-axis.
<code>arrow</code>	specification for arrow heads, as created by arrow
<code>check_overlap</code>	If TRUE, text that overlaps previous text in the same layer will not be plotted. <code>check_overlap</code> takes place at draw time and in the order of the data, thus its action depends of the size at which the plot is drawn.
<code>na.rm</code>	If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
<code>show.legend</code>	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
<code>inherit.aes</code>	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .

Details

Note that when you resize a plot, text labels stay the same size, even though the size of the plot area changes. This happens because the "width" and "height" of a text element are 0. Obviously, text labels do have height and width, but they are physical units, not data units. For the same reason, stacking and dodging text will not work by default, and axis limits are not automatically expanded to include all text.

By default this geom uses `'position_nudge_center()'` which is backwards compatible with `'position_nudge()'` from `'ggplot2'` but provides additional control on the direction of the nudging. In contrast to `'position_nudge()'`, `'position_nudge_center()'` and `'position_nudge_line()'` preserve the original coordinates.

Value

A plot layer instance.

Under development

This is a very simple and preliminary version of a geom. I plan to add features like padding around text and points. I aim to make use of the new features of `'grid'` in R \geq 4.1.0 to keep the implementation as fast and simple as possible. Currently this geom does all drawing using at most two vectorized calls to `'grid'` functions. As a temporary replacement of padding around text one can use `'slightly out-of-range'` numeric values for justification as shown in the examples.

Alignment

You can modify text alignment with the ‘vjust’ and ‘hjust’ aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character (“left”, “middle”, “right”, “bottom”, “center”, “top”). There are several two special alignments: “inward” and “outward”. Inward always aligns text towards the center of the plotting area, and outward aligns it away from the center of the plotting area. It tagged with ‘_mean’ or ‘_median’ the mean or median of the data in the panel along the corresponding axis is used as center.

Examples

```
my.cars <- mtcars[c(TRUE, FALSE, FALSE, FALSE), ]
my.cars$name <- rownames(my.cars)
p <- ggplot(my.cars, aes(wt, mpg, label = name))

# default behavior is as for geom_text()
p + geom_text_linked()
# Avoid overlaps
p + geom_text_linked(check_overlap = TRUE)
# Change size of the label
p + geom_text_linked(size = 2.5)

# Use nudging
p +
  geom_point() +
  geom_text_linked(hjust = -0.04, nudge_x = 0.12) +
  expand_limits(x = 6.2)
p +
  geom_point() +
  geom_text_linked(hjust = -0.04, nudge_x = 0.12,
    arrow = arrow(length = grid::unit(1.5, "mm"))) +
  expand_limits(x = 6.2)
p +
  geom_point() +
  geom_text_linked(vjust = -0.5, nudge_y = 0.5)
p +
  geom_point() +
  geom_text_linked(hjust = -0.02, nudge_x = 0.1,
    vjust = -0.2, nudge_y = 0.5)
p +
  geom_point() +
  geom_text_linked(angle = 90,
    hjust = -0.04, nudge_y = 1,
    arrow = arrow(length = grid::unit(1.5, "mm"))) +
  expand_limits(y = 40)

# Add aesthetic mappings
p +
  geom_point() +
  geom_text_linked(aes(colour = factor(cyl)),
    angle = 90,
    hjust = -0.04, nudge_y = 1,
```

```

      arrow = arrow(length = grid::unit(1.5, "mm")) +
      scale_colour_discrete(l = 40) +
      expand_limits(y = 40)

p + geom_text_linked(aes(size = wt)) +
  expand_limits(x = c(2, 6))
# Scale height of text, rather than sqrt(height)
p +
  geom_text_linked(aes(size = wt)) +
  scale_radius(range = c(3,6)) +
  expand_limits(x = c(2, 6))

# You can display expressions by setting parse = TRUE. The
# details of the display are described in ?plotmath, but note that
# geom_text_linked uses strings, not expressions.
p +
  geom_text_linked(
    aes(label = paste(wt, "^(", cyl, ")", sep = "")),
    parse = TRUE
  )

# Add a text annotation
p +
  geom_text_linked() +
  annotate(
    "text_linked", label = "plot mpg vs. wt",
    x = 2, y = 15, size = 3, colour = "red"
  ) +
  expand_limits(x = c(1.5, 6))

# Justification -----
df <- data.frame(
  x = c(1, 1, 2, 2, 1.5),
  y = c(1, 2, 1, 2, 1.5),
  text = c("bottom-left", "bottom-right", "top-left", "top-right", "center")
)
ggplot(df, aes(x, y)) +
  geom_text_linked(aes(label = text))
ggplot(df, aes(x, y)) +
  geom_text_linked(aes(label = text), vjust = "inward", hjust = "inward")

ggplot(df, aes(x - 1.5, y - 1.5)) +
  geom_text_linked(aes(label = text), vjust = "outward_median", hjust = "outward_median")

```

geom_x_margin_arrow *Reference arrows on the margins*

Description

Small arrows on plot margins can supplement a 2d display with annotations. Arrows can be used to highlight specific values along a margin. The geometries `geom_x_margin_arrow()` and `geom_y_margin_arrow()` behave similarly `geom_vline()` and `geom_hline()` and share their "double personality" as both annotations and geometries.

Usage

```

geom_x_margin_arrow(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  xintercept,
  sides = "b",
  arrow.length = 0.03,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)

geom_y_margin_arrow(

```

```

mapping = NULL,
data = NULL,
stat = "identity",
position = "identity",
...,
yintercept,
sides = "l",
arrow.length = 0.03,
na.rm = FALSE,
show.legend = FALSE,
inherit.aes = FALSE
)

```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific dataset - only needed if you want to override the plot defaults.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.
xintercept, yintercept	numeric Parameters that control the position of the marginal points. If these are set, data, mapping and show.legend are overridden.
sides	A string that controls which sides of the plot the rugs appear on. It can be set to a string containing any of "trbl", for top, right, bottom, and left.
arrow.length	numeric value expressed in npc units for the length of the arrows inwards from the edge of the plotting area.
na.rm	If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .

Value

A plot layer instance.

p
p + geom_x_margin_arrow(xintercept = 3.5)
p + geom_y_margin_arrow(yintercept = c(18, 28, 15))
p + geom_x_margin_arrow(data = data.frame(x = c(2.5, 4.5)),
  mapping = aes(xintercept = x))
p + geom_x_margin_arrow(data = data.frame(x = c(2.5, 4.5)),
  mapping = aes(xintercept = x),
  sides="tb")
```

geom_x_margin_grob *Add Grobs on the margins*

Description

Marging points can supplement a 2d display with annotations. Marging points can highlight individual cases or values along a margin. The geometries `geom_x_margin_grob()` and `geom_y_margin_grob()` behave similarly `geom_vline()` and `geom_hline()` and share their "double personality" as both annotations and geometries.

Usage

```
geom_x_margin_grob(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  xintercept,
  sides = "b",
  grob.shift = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

```
geom_y_margin_grob(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  yintercept,
  sides = "l",
```

```

  grob.shift = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)

```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific dataset - only needed if you want to override the plot defaults.
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.
xintercept, yintercept	numeric Parameters that control the position of the marginal points. If these are set, data, mapping and show.legend are overridden.
sides	A character string of length one that controls on which side of the plot the grob annotations appear on. It can be set to a string containing one of "t", "r", "b" or "l", for top, right, bottom, and left.
grob.shift	numeric value expressed in npc units for the shift of the marginal grob inwards from the edge of the plotting area.
na.rm	If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .

Value

A plot layer instance.

geom_x_margin_point *Reference points on the margins*

Description

Marging points can supplement a 2d display with annotations. Marging points can highlight individual cases or values along a margin. The geometries `geom_x_margin_point()` and `geom_y_margin_point()` behave similarly `geom_vline()` and `geom_hline()` and share their "double personality" as both annotations and geometries.

Usage

```
geom_x_margin_point(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  xintercept,
  sides = "b",
  point.shift = 0.017,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

```
geom_y_margin_point(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  yintercept,
  sides = "l",
  point.shift = 0.017,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

Arguments

<code>mapping</code>	The aesthetic mapping, usually constructed with <code>aes</code> or <code>aes_</code> . Only needs to be set at the layer level if you are overriding the plot defaults.
<code>data</code>	A layer specific dataset - only needed if you want to override the plot defaults.
<code>stat</code>	The statistical transformation to use on the data for this layer, as a string.

position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.
xintercept, yintercept	numeric Parameters that control the position of the marginal points. If these are set, data, mapping and show.legend are overridden.
sides	A string that controls which sides of the plot the rugs appear on. It can be set to a string containing any of "trbl", for top, right, bottom, and left.
point.shift	numeric value expressed in npc units for the shift of the rug points inwards from the edge of the plotting area.
na.rm	If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .

Value

A plot layer instance.

See Also

Other Geometries for marginal annotations in ggplots: [geom_x_margin_arrow\(\)](#), [geom_x_margin_grob\(\)](#)

Examples

```
p <- ggplot(mtcars, aes(wt, mpg)) +
  geom_point()
p
p + geom_x_margin_point(xintercept = 3.5)
p + geom_y_margin_point(yintercept = c(18, 28, 15))
p + geom_x_margin_point(data = data.frame(x = c(2.5, 4.5)),
  mapping = aes(xintercept = x))
p + geom_x_margin_point(data = data.frame(x = c(2.5, 4.5)),
  mapping = aes(xintercept = x),
  sides="tb")
```

ggplot

*Create a new ggplot plot from time series data***Description**

`ggplot()` initializes a `ggplot` object. It can be used to declare the input spectral object for a graphic and to optionally specify the set of plot aesthetics intended to be common throughout all subsequent layers unless specifically overridden.

Usage

```
## S3 method for class 'ts'
ggplot(
  data,
  mapping = NULL,
  ...,
  time.resolution = "day",
  as.numeric = TRUE,
  environment = parent.frame()
)

## S3 method for class 'xts'
ggplot(
  data,
  mapping = NULL,
  ...,
  time.resolution = "day",
  as.numeric = TRUE,
  environment = parent.frame()
)
```

Arguments

<code>data</code>	Default spectrum dataset to use for plot. If not a spectrum, the methods used will be those defined in package <code>ggplot2</code> . See ggplot . If not specified, must be supplied in each layer added to the plot.
<code>mapping</code>	Default list of aesthetic mappings to use for plot. If not specified, in the case of spectral objects, a default mapping will be used.
<code>...</code>	Other arguments passed on to methods. Not currently used.
<code>time.resolution</code>	character The time unit to which the returned time values will be rounded.
<code>as.numeric</code>	logical If TRUE convert time to numeric, expressed as fractional calendar years.
<code>environment</code>	If an variable defined in the aesthetic mapping is not found in the data, <code>ggplot</code> will look for it in this environment. It defaults to using the environment in which <code>ggplot()</code> is called.

Details

`ggplot()` is typically used to construct a plot incrementally, using the `+` operator to add layers to the existing `ggplot` object. This is advantageous in that the code is explicit about which layers are added and the order in which they are added. For complex graphics with multiple layers, initialization with `ggplot` is recommended.

There are three common ways to invoke `ggplot`:

- `ggplot(ts, aes(x, y, <other aesthetics>))`
- `ggplot(ts)`

The first method is recommended if all layers use the same data and the same set of aesthetics, although this method can also be used to add a layer using data from another data frame. See the first example below. The second method specifies the default spectrum object to use for the plot, and the units to be used for `y` in the plot, but no aesthetics are defined up front. This is useful when one data frame is used predominantly as layers are added, but the aesthetics may vary from one layer to another. The third method specifies the default spectrum object to use for the plot, but no aesthetics are defined up front. This is useful when one spectrum is used predominantly as layers are added, but the aesthetics may vary from one layer to another.

Value

A "ggplot" object.

Note

Current implementation does not merge default mapping with user supplied mapping. If user supplies a mapping, it is used as is. To add to the default mapping, `aes()` can be used by itself to compose the `ggplot`.

Examples

```
library(ggplot2)
ggplot(lynx) + geom_line()
```

`position_nudge_center` *Nudge labels away from a central point*

Description

`'position_nudge_center()'` is generally useful for adjusting the position of labels or text, both on a discrete or continuous scale. In contrast to `[ggplot2::position_nudge]`, `'position_nudge_center()'` returns in `'data'` both the original coordinates and the nudged coordinates.

Usage

```
position_nudge_center(
  x = 0,
  y = 0,
  center_x = NULL,
  center_y = NULL,
  direction = NULL,
  obey_grouping = NULL
)
```

```
position_nudge_centre(
  x = 0,
  y = 0,
  center_x = NULL,
  center_y = NULL,
  direction = NULL,
  obey_grouping = NULL
)
```

```
position_nudge_keep(x = 0, y = 0)
```

Arguments

<code>x, y</code>	Amount of vertical and horizontal distance to move. A numeric vector of length 1, or of the same length as rows there are in 'data',
<code>center_x, center_y</code>	The coordinates of the virtual origin out from which nudging radiates or splits in opposite directions. A numeric vector of length 1 or of the same length as rows there are in 'data', or a function returning either of these vectors computed from the variables in data mapped to 'x' or 'y', respectively.
<code>direction</code>	One of "none", "radial", or "split". A value of "none" replicates the behavior of <code>[ggplot2::position_nudge]</code> . Which of these three values is the default depends on the values passed to the other parameters.
<code>obey_grouping</code>	A logical flag indicating whether to obey or not groupings of the observations. By default, grouping is obeyed when both of the variables mapped to <code>_x_</code> and <code>_y_</code> are continuous numeric and ignored otherwise.

Details

This position function is backwards compatible with `[ggplot2::position_nudge]` but extends it by adding support for nudging that varies across the plotting region, either in opposite directions or radially from a virtual `_center_point_`.

The wrapper `'position_nudge_keep()'` with exactly the same signature and behaviour as `[ggplot2::position_nudge]` provides an easier to remember name when the desire is only to have access to both the original and nudged coordinates.

Positive values as arguments to 'x' and 'y' are added to the original position along either axis. If no arguments are passed to 'center_x', 'center_y' or 'direction', the nudging is applied as is, as is the

case if `direction = "none"`. If non-`'NULL'` arguments are passed to both `'center_x'` and `'center_y'`, `direction = "radial"` is assumed. In this case, if `'x'` and/or `'y'` positive nudging is applied radially outwards from the center, while if negative, inwards towards the center. When a non-`'NULL'` argument is passed only to one of `'center_x'` or `'center_y'`, `direction = "split"` is assumed. In this case when the initial location of the point is to the left of `'center_x'`, `'-x'` is used instead of `'x'` for nudging, and when the initial location of the point is to the below of `'center_y'`, `'-y'` is used instead of `'y'` for nudging. If non-`'NULL'` arguments are passed to both `'center_x'` and `'center_y'`, and `'direction'` is passed `"split"` as argument, then the split as described above is applied to both `_x_` and `_y_` coordinates.

Value

A "Position" object.

Note

Some situations are handled as special cases. When `direction = "split"` or `direction = "radial"`, observations at exactly the `_center_` are nudged using `'x'` and `'y'` unchanged. When `direction = "split"`, and both `'center_x'` and `'center_y'` have been supplied, segments are drawn at eight different possible angles. When segments are exactly horizontal or vertical they would be shorter than when drawn at the other four angles, in which case `'x'` or `'y'` are extended to ensure these segments are of the same lengths as those at other angles.

This position is most useful when labeling points forming a cloud or along vertical or horizontal lines or "divides".

```

position_nudge_line *Nudge labels away from a line*

Description

‘position_nudge_line’ is generally useful for adjusting the starting position of labels or text to be repelled while preserving the original position as the start of the segments. The difference compared to [position_nudge_center()] is that the nudging is away from from a line or curve fitted to the data points or supplied as coefficients. While [position_nudge_center()] is most useful for "round-shaped", vertically- or horizontally elongated clouds of points, [position_nudge_line()] is most suitable when observations follow a linear or curvilinear relationship between `_x_` and `_y_` values. In contrast to [ggplot2::position_nudge], ‘position_nudge_line()’ returns in ‘data’ both the original coordinates and the nudged coordinates.

Usage

```
position_nudge_line(
```

```

x = NA_real_,
y = NA_real_,
xy_relative = c(0.03, 0.03),
abline = NULL,
method = NULL,
formula = y ~ x,
direction = NULL,
line_nudge = 1
)

```

Arguments

x, y	Amount of vertical and horizontal distance to move. A numeric vector of length 1, or of the same length as rows there are in 'data'.
xy_relative	Nudge relative to <code>_x_</code> and <code>_y_</code> data expanse, ignored unless 'x' and 'y' are both 'NA's.
abline	a vector of length two giving the intercept and slope.
method	One of "spline", "lm" or "auto".
formula	A model formula for [lm()] when 'method = "lm"'. Ignored otherwise.
direction	One of "none", or "split".
line_nudge	A positive multiplier ≥ 1 , increasing nudging away from the curve or line compared to nudging from points.

Details

The default amount of nudging is 3 `_x_` and `_y_` axes, which in most cases is good. In most cases it is best to apply nudging along a direction perpendicular to the line or curve, if this is the aim, passing an argument to only one of 'x', 'y' or 'xy_relative' will be enough. When 'direction = "split"' nudging is away from an implicit line or curve on either side with positive nudging. The line of curve can be smooth spline or linear regression fitted on-the-fly to the data points, or a straight line defined by its coefficients passed to 'abline'. The fitting is well defined only if the observations fall roughly on a curve or straight line that is monotonic in 'y'. By means of 'line_nudge' one can increment nudging away from the line or curve compared to away from the points, which is useful for example to keep labels outside of a confidence band. Direction defaults to "split" when 'line_nudge > 1', and otherwise to "none".

Value

A "Position" object.

Note

For 'method = "lm"' only model formulas corresponding to polynomials with no missing terms are supported. If using [poly()], 'raw = TRUE' is required.

In practice, 'x' and 'y' should have the same sign for nudging to work correctly.

This position is most useful when labeling points conforming a cloud along an arbitrary curve or line.

position_nudge_to *Nudge labels to new positions*

Description

'position_nudge_to()' is generally useful for adjusting the position of labels or text, both on a discrete or continuous scale. This version from package 'ggpmisc' differs from [ggplot2::position_nudge] in that the coordinates of the new position is given directly, rather than as a displacement from the original location. As other position functions in this package, it preserves the original position to allow the text to be linked back to its original position with a segment or arrow.

Usage

```
position_nudge_to(x = NULL, y = NULL)
```

Arguments

x, y Coordinates of the destination position. A numeric vector of length 1, or of the same length as rows there are in 'data'. The default, 'NULL', leaves the original coordinates unchanged.

Details

The new 'x' or 'y' replace the original ones, while the original coordinates are returned in 'x_orig' and 'y_orig'.

Value

A "Position" object.

See Also

[ggplot2::position_nudge()], [ggrepel::position_nudge_repel()].

Other position adjustments: [position_nudge_center\(\)](#), [position_nudge_line\(\)](#)

Examples

```
df <- data.frame(
  x = c(1,3,2,5,4,2.5),
  y = c(2, 1, 2.5, 1.8, 2.8, 1.5),
  label = c("abc", "cd", "d", "c", "bcd", "a")
)

ggplot(df, aes(x, y, label = label)) +
  geom_point() +
  geom_text(position = position_nudge_to(y = 3))
)

ggplot(df, aes(x, y, label = label)) +
  geom_point() +
  geom_text_linked(position = position_nudge_to(y = 3),
                  vjust = -0.2)
```

scale_continuous_npc *Position scales for continuous data (npcx & npcy)*

Description

‘scale_npcx_continuous()’ and ‘scale_npcy_continuous()’ are scales for continuous npcx and npcyc aesthetics expressed in "npc" units. There are no variants. Obviously limits are always the full range of "npc" units and transformations meaningless. These scales are used by the newly defined aesthetics npcx and npcyc.

Usage

```
scale_npcx_continuous(...)
```

```
scale_npcy_continuous(...)
```

Arguments

... Other arguments passed on to ‘continuous_scale()’

Value

A "Scale" object.

stat_apply_group	<i>Apply a function to x or y values</i>
------------------	------------------------------------------

Description

stat_summary_xy() and stat_centroid() are similar to ggplot2::stat_summary() but summarize both x and y values in the same plot layer. Differently to stat_summary() no grouping based on data values is done; the grouping respected is that already present based on mappings to aesthetics. This makes it possible to highlight the actual location of the centroid with geom_point(), geom_text(), and similar geometries. Instead, if we use geom_rug() they are only a convenience avoiding the need to add two separate layers and flipping one of them using orientation = "y".

Usage

```
stat_apply_group(  
  mapping = NULL,  
  data = NULL,  
  geom = "line",  
  .fun.x = NULL,  
  .fun.x.args = list(),  
  .fun.y = NULL,  
  .fun.y.args = list(),  
  position = "identity",  
  na.rm = FALSE,  
  show.legend = FALSE,  
  inherit.aes = TRUE,  
  ...  
)
```

```
stat_summary_xy(  
  mapping = NULL,  
  data = NULL,  
  geom = "point",  
  .fun.x = NULL,  
  .fun.x.args = list(),  
  .fun.y = NULL,  
  .fun.y.args = list(),  
  position = "identity",  
  na.rm = FALSE,  
  show.legend = FALSE,  
  inherit.aes = TRUE,  
  ...  
)
```

```
stat_centroid(  
  mapping = NULL,  
  data = NULL,
```

```

geom = "point",
.fun = NULL,
.fun.args = list(),
position = "identity",
na.rm = FALSE,
show.legend = FALSE,
inherit.aes = TRUE,
...
)

```

Arguments

mapping	The aesthetic mapping, usually constructed with aes . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific dataset - only needed if you want to override the plot defaults.
geom	The geometric object to use display the data
.fun.x, .fun.y, .fun	function to be applied or the name of the function to be applied as a character string.
.fun.x.args, .fun.y.args, .fun.args	additional arguments to be passed to the function as a named list.
position	The position adjustment to use for overlapping points on this layer
na.rm	a logical value indicating whether NA values should be stripped before the computation proceeds.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.

Details

`stat_apply_group` applies functions to data. When possible it is preferable to use transformations through scales or summary functions such as `ggplot2::stat_summary()`, `stat_summary_xy()` or `stat_centroid()`. There are some computations that are not scale transformations but are not usual summaries either, as the number of data values does not decrease all the way to one row per group. A typical case for a summary is the computation of quantiles. For transformations are cumulative ones, e.g., using `cumsum()`, `runmed()` and similar functions. Obviously, it is always possible to apply such functions to the data before plotting and passing them to a single layer function. However, it can be useful to apply such functions on-the-fly to ensure that grouping is consistent between computations and aesthetics. One particularity of these statistics is that they can apply simultaneously different functions to x values and to y values when needed. In contrast to these statistics, [geom_smooth](#) applies a function that takes both x and y values as arguments.

These four statistics are similar. They differ on whether they return a single or multiple rows of data per group.

Value

A data frame with the same variables as the data input, with either a single or multiple rows, with the values of `x` and `y` variables replaced by the values returned by the applied functions, or possibly filled with `NA` if no function was supplied or available by default. If the applied function returns a named vector, the names are copied into columns `x.names` and/or `y.names`. If the summary function applied returns a one row data frame, it will be column bound keeping the column names, but overwriting columns `x` and/or `y` with `y` from the summary data frame. In the names returned by `.fun.x` the letter "y" is replaced by "x". These allows the use of the same functions as in `ggplot2::stat_summary()`.

x x-value as returned by `.fun.x`, with names removed

y y-value as returned by `.fun.y`, with names removed

x.names if the x-value returned by `.fun.x` is named, these names

y.names if the y-value returned by `.fun.y` is named, these names

xmin, xmax values returned by `.fun.x` under these names, if present

ymin, ymax values returned by `.fun.y` under these names, if present

<other> additional values as returned by `.fun.y` under other names

Note

The applied function(s) must accept as first argument a vector that matches the variables mapped to `x` or `y` aesthetics. For `stat_summary_xy()` and `stat_centroid()` the function(s) to be applied is(are) expected to return a vector of length 1 or a data frame with only one row, as `mean_se()`, `mean_cl_normal()` `mean_cl_boot()`, `mean_sdl()` and `median_hilow()` from 'ggplot2' do.

For `stat_apply_group` the vectors returned by the the functions applied to `x` and `y` must be of exactly the same length. When only one of `.fun.x` or `.fun.y` are passed a function as argument, the other variable in the returned data is filled with `NA_real_`. If other values are desired, they can be set by means of a user-defined function.

```

stat_dens1d_filter *Filter observations by local 1D density*

Description

`stat_dens1d_filter` Filters-out/filters-in observations in regions of a plot panel with high density of observations, based on the values mapped to one of `x` and `y` aesthetics. `stat_dens1d_filter_g` does the same filtering by group instead of by panel. This second stat is useful for highlighting observations, while the first one tends to be most useful when the aim is to prevent clashes among text labels.

Usage

```

stat_dens1d_filter(
  mapping = NULL,
  data = NULL,
  geom = "point",
  position = "identity",
  ...,
  keep.fraction = 0.1,
  keep.number = Inf,
  keep.sparse = TRUE,
  invert.selection = FALSE,

```

```

    bw = "SJ",
    kernel = "gaussian",
    adjust = 1,
    n = 512,
    orientation = "x",
    na.rm = TRUE,
    show.legend = FALSE,
    inherit.aes = TRUE
  )

stat_dens1d_filter_g(
  mapping = NULL,
  data = NULL,
  geom = "point",
  position = "identity",
  keep.fraction = 0.1,
  keep.number = Inf,
  keep.sparse = TRUE,
  invert.selection = FALSE,
  na.rm = TRUE,
  show.legend = FALSE,
  inherit.aes = TRUE,
  bw = "SJ",
  adjust = 1,
  kernel = "gaussian",
  n = 512,
  orientation = "x",
  ...
)

```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific dataset - only needed if you want to override the plot defaults.
geom	The geometric object to use display the data.
position	The position adjustment to use for overlapping points on this layer
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.
keep.fraction	numeric [0..1]. The fraction of the observations (or rows) in data to be retained.
keep.number	integer Set the maximum number of observations to retain, effective only if obeying <code>keep.fraction</code> would result in a larger number.
keep.sparse	logical If TRUE, the default, observations from the more sparse regions are retained, if FALSE those from the densest regions.
invert.selection	logical If TRUE, the complement of the selected rows are returned.

bw	numeric or character The smoothing bandwidth to be used. If numeric, the standard deviation of the smoothing kernel. If character, a rule to choose the bandwidth, as listed in bw.nrd .
kernel	character See density for details.
adjust	numeric A multiplicative bandwidth adjustment. This makes it possible to adjust the bandwidth while still using the a bandwidth estimator through an argument passed to bw. The larger the value passed to adjust the stronger the smoothing, hence decreasing sensitivity to local changes in density.
n	numeric Number of equally spaced points at which the density is to be estimated for applying the cut point. See density for details.
orientation	character The aesthetic along which density is computed. Given explicitly by setting orientation to either "x" or "y".
na.rm	a logical value indicating whether NA values should be stripped before the computation proceeds.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .

Value

A plot layer instance. Using as output data a subset of the rows in input data retained based on a 1D filtering criterion.

```

stat_dens1d_labels *Replace labels in data based on 1D density*

Description

stat_dens1d_labels() Sets values mapped to the label aesthetic to "" or a user provided character string based on the local density in regions of a plot panel. Its main use is together with repulsive geoms from package [ggrepel](#). If there is no mapping to label in data, the mapping is set to rownames(data), with a message.

Usage

```

stat_dens1d_labels(
  mapping = NULL,
  data = NULL,
  geom = "text",
  position = "identity",
  ...,
  keep.fraction = 0.1,
  keep.number = Inf,
  keep.sparse = TRUE,
  invert.selection = FALSE,
  bw = "SJ",

```

```

kernel = "gaussian",
adjust = 1,
n = 512,
orientation = "x",
label.fill = "",
na.rm = TRUE,
show.legend = FALSE,
inherit.aes = TRUE
)

```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific dataset - only needed if you want to override the plot defaults.
geom	The geometric object to use display the data.
position	The position adjustment to use for overlapping points on this layer
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.
keep.fraction	numeric [0..1]. The fraction of the observations (or rows) in data to be retained.
keep.number	integer Set the maximum number of observations to retain, effective only if obeying <code>keep.fraction</code> would result in a larger number.
keep.sparse	logical If TRUE, the default, observations from the more sparse regions are retained, if FALSE those from the densest regions.
invert.selection	logical If TRUE, the complement of the selected rows are returned.
bw	numeric or character The smoothing bandwidth to be used. If numeric, the standard deviation of the smoothing kernel. If character, a rule to choose the bandwidth, as listed in bw.nrd .
kernel	character See density for details.
adjust	numeric A multiplicative bandwidth adjustment. This makes it possible to adjust the bandwidth while still using the a bandwidth estimator through an argument passed to <code>bw</code> . The larger the value passed to <code>adjust</code> the stronger the smoothing, hence decreasing sensitivity to local changes in density.
n	numeric Number of equally spaced points at which the density is to be estimated for applying the cut point. See density for details.
orientation	character The aesthetic along which density is computed. Given explicitly by setting <code>orientation</code> to either "x" or "y".
label.fill	character vector of length 1 or a function.
na.rm	a logical value indicating whether NA values should be stripped before the computation proceeds.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .

Details

stat_dens1d_labels() is designed to work together with statistics from package 'ggrepel'. To avoid text labels being plotted over unlabelled points the corresponding rows in data need to be retained but labels replaced with the empty character string, "". This makes [stat_dens1d_filter](#) unsuitable for the task. Non-the-less stat_dens1d_labels() could be useful in some other cases, as the substitution character string can be set by the user.

Value

A plot layer instance. Using as output data the input data after value substitution based on a 1D the filtering criterion.

See Also

[density](#) used internally.

Other statistics returning a subset of data: [stat_dens1d_filter\(\)](#), [stat_dens2d_filter\(\)](#), [stat_dens2d_labels\(\)](#)

Examples

```
random_string <-
  function(len = 6) {
    paste(sample(letters, len, replace = TRUE), collapse = "")

stat_dens2d_filter *Filter observations by local 2D density*

Description

stat_dens2d_filter Filters-out/filters-in observations in regions of a plot panel with high density of observations, based on the values mapped to both x and y aesthetics. stat_dens2d_filter_g

does the filtering by group instead of by panel. This second stat is useful for highlighting observations, while the first one tends to be most useful when the aim is to prevent clashes among text labels.

Usage

```
stat_dens2d_filter(
  mapping = NULL,
  data = NULL,
  geom = "point",
  position = "identity",
  keep.fraction = 0.1,
  keep.number = Inf,
  keep.sparse = TRUE,
  invert.selection = FALSE,
  na.rm = TRUE,
  show.legend = FALSE,
  inherit.aes = TRUE,
  h = NULL,
  n = NULL,
  ...
)
```

```
stat_dens2d_filter_g(
  mapping = NULL,
  data = NULL,
  geom = "point",
  position = "identity",
  keep.fraction = 0.1,
  keep.number = Inf,
  keep.sparse = TRUE,
  invert.selection = FALSE,
  na.rm = TRUE,
  show.legend = FALSE,
  inherit.aes = TRUE,
  h = NULL,
  n = NULL,
  ...
)
```

Arguments

mapping	The aesthetic mapping, usually constructed with <code>aes</code> or <code>aes_</code> . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific dataset - only needed if you want to override the plot defaults.
geom	The geometric object to use display the data.
position	The position adjustment to use for overlapping points on this layer
keep.fraction	numeric [0..1]. The fraction of the observations (or rows) in data to be retained.

keep.number	integer	Set the maximum number of observations to retain, effective only if obeying keep.fraction would result in a larger number.
keep.sparse	logical	If TRUE, the default, observations from the more sparse regions are retained, if FALSE those from the densest regions.
invert.selection	logical	If TRUE, the complement of the selected rows are returned.
na.rm	logical	a logical value indicating whether NA values should be stripped before the computation proceeds.
show.legend	logical	Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	logical	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .
h	vector	of bandwidths for x and y directions. Defaults to normal reference bandwidth (see bandwidth.nrd). A scalar value will be taken to apply to both directions.
n	integer	Number of grid points in each direction. Can be scalar or a length-2 integer vector
...		other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.

Value

A plot layer instance. Using as output data a subset of the rows in input data retained based on a 2D-density-based filtering criterion.

```

stat_dens2d_labels *Replace labels in data based on 2D density*

Description

stat_dens2d_labels() Sets values mapped to the label aesthetic to "" or a user provided character string based on the local density in regions of a plot panel. Its main use is together with repulsive geoms from package [ggrepel](#). If there is no mapping to label in data, the mapping is set to rownames(data), with a message.

Usage

```

stat_dens2d_labels(
  mapping = NULL,
  data = NULL,
  geom = "text",
  position = "identity",
  ...,
  keep.fraction = 0.1,
  keep.number = Inf,
  keep.sparse = TRUE,
  invert.selection = FALSE,
  h = NULL,
  n = NULL,
  label.fill = "",
  na.rm = TRUE,
  show.legend = FALSE,
  inherit.aes = TRUE
)

```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific dataset - only needed if you want to override the plot defaults.
geom	The geometric object to use display the data.
position	The position adjustment to use for overlapping points on this layer
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.
keep.fraction	numeric [0..1]. The fraction of the observations (or rows) in data to be retained.

keep.number	integer Set the maximum number of observations to retain, effective only if obeying keep.fraction would result in a larger number.
keep.sparse	logical If TRUE, the default, observations from the more sparse regions are retained, if FALSE those from the densest regions.
invert.selection	logical If TRUE, the complement of the selected rows are returned.
h	vector of bandwidths for x and y directions. Defaults to normal reference bandwidth (see bandwidth.nrd). A scalar value will be taken to apply to both directions.
n	Number of grid points in each direction. Can be scalar or a length-2 integer vector
label.fill	character vector of length 1 or a function.
na.rm	a logical value indicating whether NA values should be stripped before the computation proceeds.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders .

Details

stat_dens2d_labels() is designed to work together with statistics from package 'ggrepel'. To avoid text labels being plotted over unlabelled points the corresponding rows in data need to be retained but labels replaced with the empty character string, "". This makes [stat_dens2d_filter](#) unsuitable for the task. Non-the-less stat_dens2d_labels() could be useful in some other cases, as the substitution character string can be set by the user.

Value

A plot layer instance. Using as output data the input data after value substitution based on a 2D the filtering criterion.

stat_fmt_tb

Select and slice a tibble nested in data

Description

stat_fmt_tb selects, reorders and/or renames columns and or rows of a tibble nested in data. This stat is intended to be used to pre-process tibble objects mapped to the label aesthetic before adding them to a plot with geom_table.

Usage

```
stat_fmt_tb(
  mapping = NULL,
  data = NULL,
  geom = "table",
  tb.vars = NULL,
  tb.rows = NULL,
  digits = 3,
  position = "identity",
  table.theme = NULL,
  table.rownames = FALSE,
  table.colnames = TRUE,
  table.hjust = 0.5,
  parse = FALSE,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE,
  ...
)
```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific dataset - only needed if you want to override the plot defaults.
geom	The geometric object to use display the data
tb.vars, tb.rows	character or numeric vectors, optionally named, used to select and/or rename the columns or rows in the table returned.
digits	integer indicating the number of significant digits to be retained in data.
position	The position adjustment to use for overlapping points on this layer
table.theme	NULL, list or function A gridExtra ttheme definition, or a constructor for a theme or NULL for default.

<code>table.rownames</code> , <code>table.colnames</code>	logical flag to enable or disabling printing of row names and column names.
<code>table.hjust</code>	numeric Horizontal justification for the core and column headings of the table.
<code>parse</code>	If TRUE, the labels will be parsed into expressions and displayed as described in <code>?plotmath</code> .
<code>na.rm</code>	a logical indicating whether NA values should be stripped before the computation proceeds.
<code>show.legend</code>	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
<code>inherit.aes</code>	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. <code>borders</code> .
<code>...</code>	other arguments passed on to <code>layer</code> . This can include aesthetics whose values you want to set, not map. See <code>layer</code> for more details.

Value

A plot layer instance. Using as output data a copy of the input data in which the data frames mapped to `label` have been modified.

Computed variables

The output of sequentially applying `slice` with `tb.rows` as argument and `select` with `tb.vars` to a list variable mapped to `label` and containing a single tibble per row in data.

See Also

See `geom_table` for details on how tables respond to mapped aesthetics and table themes. For details on predefined table themes see `ttheme_gtdefault`.

Examples

```
my.df <-
  tibble::tibble(
    x = c(1, 2),
    y = c(0, 4),
    group = c("A", "B"),
    tbs = list(a = tibble::tibble(Xa = 1:6, Y = rep(c("x", "y"), 3)),
              b = tibble::tibble(Xb = 1:3, Y = "x"))
  )

ggplot(my.df, aes(x, y, label = tbs)) +
  stat_fmt_tb() +
  expand_limits(x = c(0,3), y = c(-2, 6))

# Hide column names, display row names
ggplot(my.df, aes(x, y, label = tbs)) +
  stat_fmt_tb(table.colnames = FALSE,
             table.rownames = TRUE) +
```

```

             tb.rows = 1:3) +
  expand_limits(x = c(0,3), y = c(-2, 6))

# selection, reordering and renaming by column position
ggplot(my.df, aes(x, y, label = tbs)) +
  stat_fmt_tb(tb.vars = c(group = 2, value = 1),
             tb.rows = 1:3) +
  expand_limits(x = c(0,3), y = c(-2, 6))

# selection and renaming, using partial matching to column name
ggplot(my.df, aes(x, y, label = tbs)) +
  stat_fmt_tb(tb.vars = c(value = "X", group = "Y"),
             tb.rows = 1:3) +
  expand_limits(x = c(0,3), y = c(-2, 6))

```

stat_quadrant_counts *Number of observations in quadrants*

Description

stat_quadrant_counts() counts the number of observations in each quadrant of a plot panel. By default it adds a text label to the far corner of each quadrant. It can also be used to obtain the total number of observations in each of two pairs of quadrants or in the whole panel. Grouping is ignored, so in every case a single count is computed for each quadrant in a plot panel.

Usage

```

stat_quadrant_counts(
  mapping = NULL,
  data = NULL,
  geom = "text_npc",
  position = "identity",
  quadrants = NULL,
  pool.along = "none",
  xintercept = 0,
  yintercept = 0,
  label.x = NULL,
  label.y = NULL,

```

```

na.rm = FALSE,
show.legend = FALSE,
inherit.aes = TRUE,
...
)

```

Arguments

mapping	The aesthetic mapping, usually constructed with aes or aes_ . Only needs to be set at the layer level if you are overriding the plot defaults.
data	A layer specific dataset - only needed if you want to override the plot defaults.
geom	The geometric object to use display the data
position	The position adjustment to use for overlapping points on this layer
quadrants	integer vector indicating which quadrants are of interest, with a 0L indicating the whole plot.
pool.along	character, one of "none", "x" or "y", indicating which quadrants to pool to calculate counts by pair of quadrants.
xintercept, yintercept	numeric the coordinates of the origin of the quadrants.
label.x, label.y	numeric Coordinates (in npc units) to be used for absolute positioning of the labels.
na.rm	a logical indicating whether NA values should be stripped before the computation proceeds.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes	If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and should not inherit behaviour from the default plot specification, e.g. borders .
...	other arguments passed on to layer . This can include aesthetics whose values you want to set, not map. See layer for more details.

Details

This statistic can be used to automatically count observations in each of the four quadrants of a plot, and by default add these counts as text labels. Values exactly equal to `xintercept` or `yintercept` are counted together with those larger than the intercepts. An argument value of zero, passed to formal parameter `quadrants` is interpreted as a request for the count of all observations in each plot panel.

The default origin of quadrants is at `xintercept = 0`, `yintercept = 0`. Also by default, counts are computed for all quadrants within the `x` and `y` scale limits, but ignoring any marginal scale expansion. The default positions of the labels is in the farthest corner or edge of each quadrant using npc coordinates. Consequently, when using facets even with free limits for `x` and `y` axes, the location of the labels is consistent across panels. This is achieved by use of `geom = "text_npc"` or `geom = "label_npc"`. To pass the positions in native data units, pass `geom = "text"` explicitly as argument.

Value

A plot layer instance. Using as output data the counts of observations per plot quadrant.

Computed variables

Data frame with one to four rows, one for each quadrant for which counts are counted in data.

quadrant integer, one of 0:4

x x value of label position in data units

y y value of label position in data units

npcx x value of label position in npc units

npcy y value of label position in npc units

count number of observations

.

As shown in one example below [geom_debug](#) can be used to print the computed values returned by any statistic. The output shown includes also values mapped to aesthetics, like label in the example.

try_data_frame

Convert an R object into a tibble

Description

This functions tries to convert any R object into a data.frame object. If x is already a data.frame, it is returned as is. If it is a list or a vector it is converted by means of as.data.frame(). If of any other type, a conversion into an object of class xts is attempted by means of try.xts() and if successful the xts object is converted into a data frame with a variable time containing times as POSIXct and the remaining data columns with the time series data. In this conversion row names are stripped.

Usage

```

try_data_frame(
  x,
  time.resolution = "month",
  as.numeric = FALSE,
  col.names = NULL
)

try_tibble(x, time.resolution = "month", as.numeric = FALSE, col.names = NULL)

```

Arguments

x	An R object
time.resolution	character The time unit to which the returned time values will be rounded.
as.numeric	logical If TRUE convert time to numeric, expressed as fractional calendar years.
col.names	character vector

Value

A `tibble::tibble` object, derived from `data.frame`.

Warning!

The time zone was set to "UTC" by `try.xts()` in the test cases I used. Setting TZ to "UTC" can cause some trouble as several frequently used functions have as default the local or system TZ and will apply a conversion before printing or plotting time data, which in addition is affected by summer/winter time transitions. This should be taken into account as even for yearly data when conversion is to POSIXct a day (1st of January) will be set, but then shifted some hours if printed on a TZ different from "UTC". I recommend reading the documentation of package [lubridate-package](#) where the irregularities of time data and the difficulties they cause are very well described. In many cases when working with time series with yearly observations it is best to work with numeric values for years.

Note

This function can be used to easily convert time series data into a format that can be easily plotted with package `ggplot2`. `try_tibble` is another name for `try_data_frame` which tracks the separation and re-naming of `data.frame` into `tibble::tibble` in the imported packages.

Examples

```
class(lynx)
try_tibble(lynx)
try_tibble(lynx, as.numeric = TRUE)
try_tibble(lynx, "year")
class(austres)
try_tibble(austres)
try_tibble(austres, as.numeric = TRUE)
try_tibble(austres, "quarter")
class(cars)
try_tibble(cars)
```

ttheme_gtdefault *Table themes*

Description

Additional theme constructors for use with [geom_table](#).

Usage

```
ttheme_gtdefault(  
  base_size = 10,  
  base_colour = "black",  
  base_family = "",  
  parse = FALSE,  
  padding = unit(c(0.8, 0.6), "char"),  
  ...  
)  
  
ttheme_gtminimal(  
  base_size = 10,  
  base_colour = "black",  
  base_family = "",  
  parse = FALSE,  
  padding = unit(c(0.5, 0.4), "char"),  
  ...  
)  
  
ttheme_gtbw(  
  base_size = 10,  
  base_colour = "black",  
  base_family = "",  
  parse = FALSE,  
  padding = unit(c(1, 0.6), "char"),  
  ...  
)  
  
ttheme_gtplain(  
  base_size = 10,  
  base_colour = "black",  
  base_family = "",  
  parse = FALSE,  
  padding = unit(c(0.8, 0.6), "char"),  
  ...  
)  
  
ttheme_gtdark(  
  base_size = 10,
```

```

    base_colour = "grey90",
    base_family = "",
    parse = FALSE,
    padding = unit(c(0.8, 0.6), "char"),
    ...
)

ttheme_gtlight(
  base_size = 10,
  base_colour = "grey10",
  base_family = "",
  parse = FALSE,
  padding = unit(c(0.8, 0.6), "char"),
  ...
)

ttheme_gtsimple(
  base_size = 10,
  base_colour = "grey10",
  base_family = "",
  parse = FALSE,
  padding = unit(c(0.5, 0.4), "char"),
  ...
)

ttheme_gtstripes(
  base_size = 10,
  base_colour = "grey10",
  base_family = "",
  parse = FALSE,
  padding = unit(c(0.8, 0.6), "char"),
  ...
)

```

Arguments

<code>base_size</code>	numeric, default font size.
<code>base_colour</code>	default font colour.
<code>base_family</code>	default font family.
<code>parse</code>	logical, default behaviour for parsing text as plotmath.
<code>padding</code>	length-2 unit vector specifying the horizontal and vertical padding of text within each cell.
<code>...</code>	further arguments to control the gtable.

Details

Depending on the theme, the `base_colour`, which is mapped to the `colour` aesthetic if present, is applied to only the text elements, or to the text elements and rules. The difference is exemplified

below.

Value

A list object that can be used as `ttheme` in the construction of tables with functions from package `'gridExtra'`.

Note

These theme constructors are wrappers on `gridExtra::ttheme_default()` and `gridExtra::ttheme_minimal()`. They can also be used with `grid.table` if desired.

Examples

```
library(dplyr)
library(tibble)

mtcars %>%
  group_by(cyl) %>%
  summarize(wt = mean(wt), mpg = mean(mpg)) %>%
  ungroup() %>%
  mutate(wt = sprintf("%.2f", wt),
         mpg = sprintf("%.1f", mpg)) -> tb

df <- tibble(x = 5.45, y = 34, tb = list(tb))

# Same as the default theme constructor
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtdefault) +
  theme_classic()

# Minimal theme constructor
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtminimal) +
  theme_classic()

# A theme with white background
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtbw) +
  theme_bw()

# Default colour of theme superceded by aesthetic constant
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtbw, colour = "darkblue") +
```

```

theme_bw()

# A theme with dark background
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtdark) +
  theme_dark()

# Default colour of theme superceded by aesthetic constant
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtdark, colour = "yellow") +
  theme_dark()

# A theme with light background
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtlight)

# Default colour of theme superceded by aesthetic constant
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtlight, colour = "darkred")

# Default colour of theme superceded by aesthetic constant
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtsimple)

# Default colour of theme superceded by aesthetic constant
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
            table.theme = ttheme_gtstripes) +
  theme_dark()

```

ttheme_set

Set default table theme

Description

Set R option to the theme to use as current default. This function is implemented differently but is used in the same way as `ggplot2::theme_set()` but affects the default table-theme instead of the plot theme.

Usage

```
ttheme_set(table.theme = NULL)
```

Arguments

`table.theme` NULL, list or function A gridExtra ttheme definition, or a constructor for a ttheme or NULL for default.

Value

A named list with the previous value of the option.

Note

The ttheme is set when a plot object is constructed, and consequently the option setting does not affect rendering of ready built plot objects.

Examples

```
library(dplyr)
library(tibble)

mtcars %>%
  group_by(cyl) %>%
  summarize(wt = mean(wt), mpg = mean(mpg)) %>%
  ungroup() %>%
  mutate(wt = sprintf("%.2f", wt),
         mpg = sprintf("%.1f", mpg)) -> tb

df <- tibble(x = 5.45, y = 34, tb = list(tb))

# Same as the default theme constructor
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb))

# set a new default
old_ttheme <- ttheme_set(ttheme_gtstripes)

ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb))

# restore previous setting
ttheme_set(old_ttheme)
```
